

BLE121LR

DATA SHEET

Wednesday, 02 December 2020

Version 1.8

VERSION HISTORY

Version	Comment
1.1	First release
1.2	Standard gain mode option for the receiver added. Figure 22 corrected. Certification info updated. Footprint and PCB land pattern figures revised. Design check list added. Layout guide updated. Range chapter added.
1.3	Stencil thickness recommendation updated
1.4	Added section on package marking
1.5	Updated description of encryption modes
1.6	Added tape and reel information
1.7	Updated certification information
1.8	Renamed "Bluetooth Smart" to "Bluetooth Low Energy" according to the official Bluetooth SIG nomenclature

BLE121LR *Bluetooth*® Low Energy Module

DESCRIPTION

BLE121LR is a Bluetooth Low Energy Long Range module targeted for *Bluetooth* Low Energy applications where the best possible RF performance and range are required. At +8 dBm TX power and -98 dBm sensitivity BLE121LR has best-in-class RF performance and can provide *Bluetooth* Low Energy connectivity up to 450 meters. BLE121LR integrates all features required for a *Bluetooth* Low Energy application: *Bluetooth* radio, software stack and GATT based profiles. and it can also host end user applications, which means no external micro controller is required in size, price or power constrained devices. BLE121LR *Bluetooth* Low Energy module also has flexible hardware interfaces to connect to different peripherals or sensors. Although BLE121LR *Bluetooth* Low Energy Long Range Module is target for applications requiring high RF performance, it is still has relatively low power consumption and can be power using a standard 3V coin cell batteries.

APPLICATIONS:

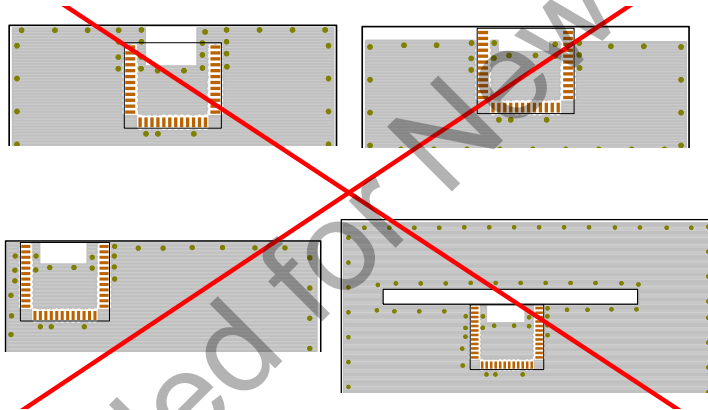

- Smart home accessories
- beacon devices
- Health and fitness sensors
- Medical sensors
- iPhone and iPad accessories
- Security and proximity tags

KEY FEATURES:

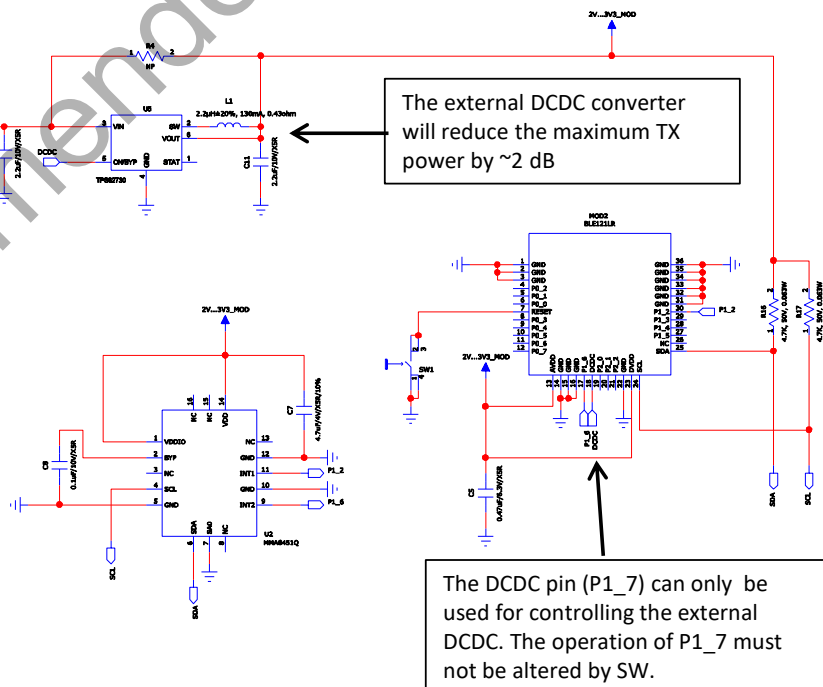

- *Bluetooth* v. 4.0 Single Mode Compliant
 - Master and slave modes
 - Up to eight connections
- Integrated *Bluetooth* Low Energy Stack
 - GAP, ATT and GATT
 - *Bluetooth* Low Energy profiles
- Best-in-Class RF Performance
 - Transmit power : +8 dBm
 - Receiver sensitivity: -98 dBm
 - Range up to 450 meters
- Low Current Consumption
 - Transmit: 36 mA (+8 dBm)
 - Receive: 33 mA (-98 dBm)
 - Power mode 3: 0.5 uA
- Flexible Peripheral Interfaces
 - UART and SPI
 - I2C, PWM and GPIO
 - 12-bit ADC
- Host Interfaces:
 - UART
- Programmable 8051 Processor for Stand-alone Operation
 - Simple Bluegiga BGScript™ scripting language for quick application development
 - Bluegiga Profile Toolkit™ allowing the quick development of GATT based profiles
- Dimensions: 14.7 x 13.0 x 1.8 mm
- *Bluetooth*, CE, FCC, IC, South Korea, Japan and Brazil qualified

1 Design Check List

- Make sure that the programming interface (P2_, P2_2, reset) is available for debugging or FW updates
- Add test points for testing the current consumption
- Make sure that all the IO's are in a known state
- Make sure that the layout under the antenna is done as instructed

Place large capacitor in parallel with the battery to reduce the peak current drawn from the battery

*) Refer to BLE Configuration Guide for detailed settings

**) SS is the slave select signal when BLE121LR is set as SPI slave. When set as SPI master, any available I/O can be used as chip select signal of BLE121LR

NOTE: Pins configured as peripheral I/O signals do not have pull-up / -down capability

Table 4: Peripheral I/O Pin Mapping

3.1 I/O Ports

3.1.1 I/O Configurations

Each I/O port can be configured as an input or output. When configured as input, each I/O port can also be configured with internal pull-up, pull-down or tri-state. Pull-down or pull-up can only be configured to whole port, not individual pins. Unused I/O pins should have defined level and not be floating. See the BLE Configuration Guide for more information about the configuration.

During reset the I/O pins are configured as inputs with pull-ups.

Note: Pins configured as peripheral I/O signals do not have pull-up / -down capability

3.1.2 Reserved I/O's

The high current driving pins P1_0 and P1_1 are reserved for the internal RF front end control. These pins are not exposed in BLE121LR and they can't be used for application purposes.

P1_7 is also used for the RF front end control but as an output it can be used to control the external DCDC for lowering the peak current drawn from the battery. The function of P1_7 can't be altered. If external DCD is not used then P1_7 should be left not connected.

3.2 UART

UART baud rate can be configured up to 2 Mbps. See the BLE Configuration Guide for more information. Following table lists commonly used baud rates for BLE121LR

Baud rate (bps)	Error (%)
2400	0.14
4800	0.14
9600	0.14
14 400	0.03
19 200	0.14
28 800	0.03
38 400	0.14
57 600	0.03
76 800	0.14
115 200	0.03
230 400	0.03

Table 5: Commonly used baud rates for BLE121LR

4 Electrical Characteristics

4.1 Absolute Maximum Ratings

Note: These are absolute maximum ratings beyond which the module can be permanently damaged. These are not maximum operating conditions. The maximum recommended operating conditions are in the Table 7.

Rating	Min	Max	Unit
Storage Temperature	-40	+85	°C
AVDD, DVDD	-0.3	3.9	V
Other Terminal Voltages	VSS-0.4	VDD+0.4	V

Table 6: Absolute Maximum Ratings

4.2 Recommended Operating Conditions

Rating	Min	Max	Unit
Operating Temperature Range	-40	+85	°C
AVDD, DVDD (*, **, ***)	2.0	3.6	V

Table 7: Recommended Operating Conditions

*) All supply nets must have the same voltage

**) Supply voltage noise should be less than 10mVpp. Excessive noise at the supply voltage will reduce the RF performance.

***) The supply voltage has an impact on the TX power, see Figure 7.

4.3 DC Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Logic-0 input voltage				0.5	V
Logic-1 input voltage	DVDD = 3V0	2.5			V
Logic-0 input current	Input equals 0V	-50		50	nA
Logic-1 input current	Input equals VDD	-50		50	nA
I/O pin pull-up and pull-down resistors			20		kΩ

For detailed I/O terminal characteristic and timings refer to the CC2541 datasheet available in (<http://www.ti.com/lit/ds/symlink/cc2541.pdf>)

Table 8: DC Characteristic

4.4 Current Consumption

Power mode	hardware.xml	Min	Typ	Max	Unit
Transmit (3V0 supply, without DCDC)	<txpower power = "1"/> <slow clock enable = "true"/>		25		mA
	<txpower power = "9"/> <slow clock enable = "true"/>		36		mA
	<txpower power = "9"/> <slow clock enable = "false"/>		39		mA
Transmit (With DCDC)	<txpower power = "9"/> <slow clock enable = "true"/>		32 **		mA
	<txpower power = "9"/> <slow clock enable = "false"/>		35 **		mA
Receive	<slow clock enable = "true"/>		28		mA
	<slow clock enable = "false"/>		33		mA
Power mode 1	<sleposc enable="true" ppm="30" />		2.7		mA
Power mode 2	<sleposc enable="true" ppm="30" />		1.3		μA
Power mode 3	***		0.5		μA

**) Using DCDC reduces transmit power by ~2 dB and thus lowers also the peak current drawn by the module

***) To enter PM1 and PM2 sleep oscillator must be enabled in the hardware.xml. PM3 is not dependent on the sleep clock. The module will enter PM3 automatically when there is no activity which would require clock.

PM3 can be disabled in hardware.xml, for example <sleep enable="true" max_mode="2" />

Figure 2: BLE121LR TX peak current as a function of the setting in the HW configuration file

Figure 3: Typical current consumption profile while advertising

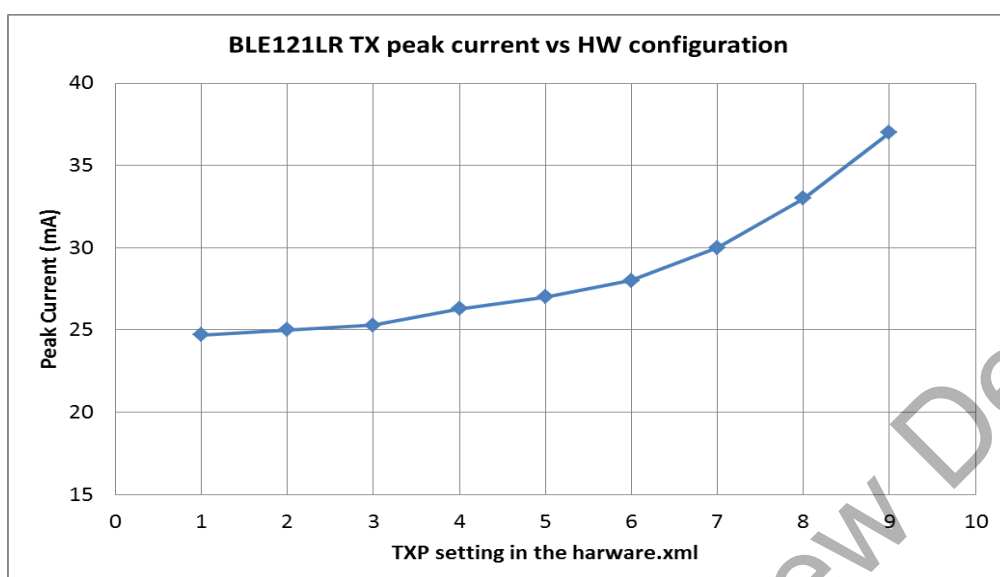

Figure 4: BLE121LR TX peak current as a function of hardware.xml TXP setting (Example: `<txpower power="9" bias="5" />`)

4.4.1 Current Consumption When Using TPS62730 DCDC Converter

TPS62730 DCDC converter provides 20% reduction to the peak current drawn from 3.0V supply and 15% reduction to the peak current drawn from 2.7V supply. This is achieved by converting higher power supply down to 2.1V supply with a switching mode regulator. The module turns the DCDC on when the processor is active and off (by-pass mode) when the processor is not active.

Because the TX power of BLE121LR depends on the supply voltage, the TX power is reduced when using TPS62730 DCDC converter. The reduced TX power in turn reduces the peak current drawn by the module. Thus when using TPS62730 with BLE121LR from 3.0V supply, the peak current is reduced in total by:

- ~4 mA because of lower TX power
- -20% because of the switching mode regulator converting from 3.0V down to 2.1V
- ➔ Peak current drawn from 3.0V supply in total (Max TXP, slow clock enabled):
 $(36 \text{ mA} - 4 \text{ mA}) * 0.8 = 25.6 \text{ mA}$

4.5 RF Characteristics

Rating	Min	Typ	Max	Unit
Transmit power		8		dBm
Transmit power variation within BT band		1	1.8	dB
Transmit power variation within the temperature range		+/-1.5		dB
Sensitivity (Default, high gain mode, PER 30.8%)		-98		dBm
Sensitivity (standard gain mode, PER 30.8%) (*)		-92		dBm

*) Standard gain mode can be set using an API command. Please refer to the Bluetooth Low Energy Software API Reference document.

Figure 10: Radiation pattern of BLE121LR when mounted to a carrier board

Figure 11: Radiation pattern of BLE121LR when mounted to a carrier board

4.6 Range of BLE121LR

Module	Typical TXP	Sensitivity	Direction	Antenna Attenuation	Link Budget	Calculated Range	Tested Range
BLE121LR	8 dBm	-98 dBm	Front	-3 dB	100 dB	470m	450m
BLE121LR	8 dBm	-98 dBm	Back	-7 dB	92 dB	300m	300m
BLE121LR	8 dBm	-98 dBm	Side	-5 dB	96 dB	370m	340m

Figure 12: Range of BLE121LR vs BLE121LR when antennas are 1.5m above GND

The range of BLE121LR is dependent on the mother board layout, height of the antennas above GND and any obstacles within the RF path or near the RF path (multipath propagation). See Figure 25 how the layout impacts to the range of BLE121LR.

In an open field the received power is a sum of the line-of-sight wave and the ground-reflected wave. Depending on the phase of the ground-reflected wave, it either amplifies or attenuates the total received power. Figure 14 shows how the antenna height from ground impacts to the RF path loss and range in an open field.

RF power propagates in free space within a virtual “pipe” which can be defined by so called Fresnel ellipsoid. Any obstacles within the area of this “pipe” will attenuate the RF power and thus decrease the actual range of the link. The radius of the “pipe” can be approximated by

$$R = \sqrt{\frac{D \times \lambda}{12}}$$

Where R is the radius, D is the distance between the antennas and lambda is the wave length (12.2 cm).

Figure 13: RF propagation area between TX and RX

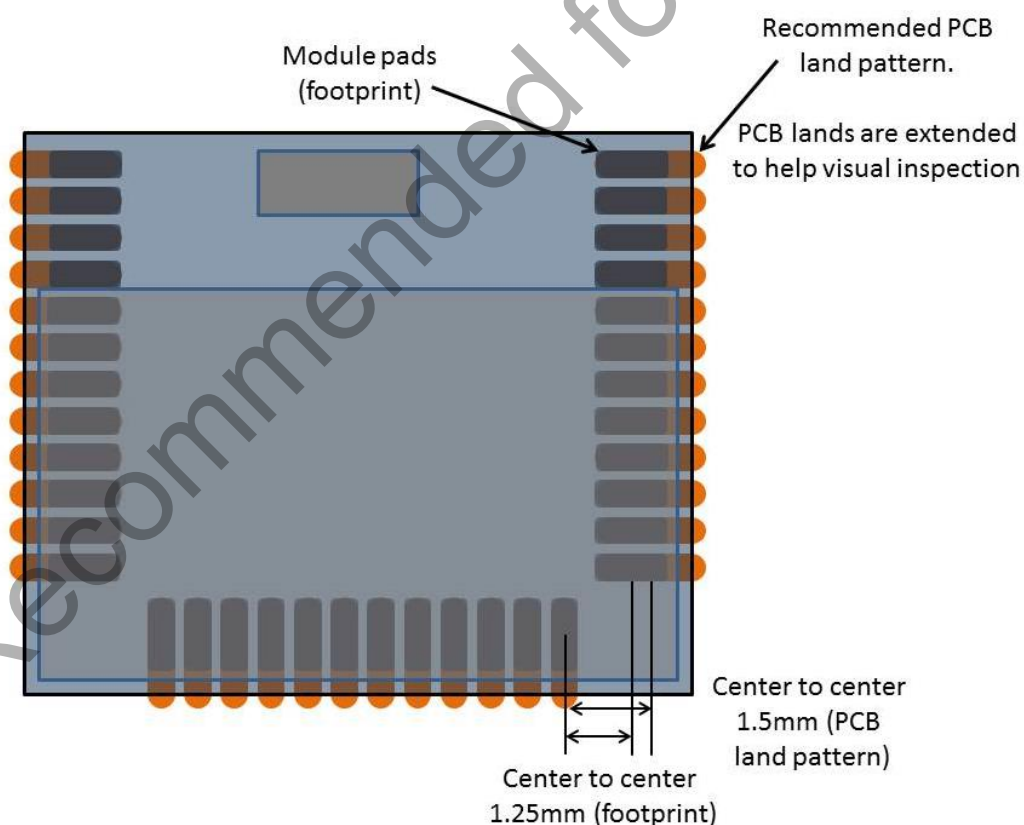

Figure 19: Module placed on the recommended PCB land pattern

6 Power-On Reset and Brownout Detector

BLE121LR includes a power-on reset (POR), providing correct initialization during device power on. It also includes a brownout detector (BOD) operating on the regulated 1.8-V digital power supply only. The BOD protects the memory contents during supply voltage variations which cause the regulated 1.8-V power to drop below the minimum level required by digital logic, flash memory, and SRAM. When power is initially applied, the POR and BOD hold the device in the reset state until the supply voltage rises above the power-on-reset and brownout voltages.

Not Recommended for New Designs

from the edges of the PCB. Connect all the GND pins directly to a solid GND plane and make sure that there is a low impedance path for the return current following the signal and supply traces all the way from start to the end.

A good practice is to dedicate one of the inner layers to a solid GND plane and one of the inner layers to supply voltage planes and traces and route all the signals on top and bottom layers of the PCB. This arrangement will make sure that any return current follows the forward current as close as possible and any loops are minimized.

Figure 21: Typical 4-layer PCB construction

Figure 22: Use of stitching vias to avoid emissions from the edges of the PCB

7.3 BLE121LR-A Layout Guide

For optimal performance of the antenna place the module at the edge of the PCB as shown in the Figure 23. Do not place any metal (traces, components, battery etc.) within the clearance area of the antenna. Connect all the GND pins directly to a solid GND plane. Place the GND vias as close to the GND pins as possible. Use good layout practices to avoid any excessive noise coupling to signal lines or supply voltage lines. Do not place plastic or any other dielectric material in touch with the antenna.

Figure 23: Recommended layout for BLE121LR-A

Figure 24: Poor layouts for BLE121LR

Figure 25: Impact of the size of GND plane to the range of BGM111

8 Soldering Recommendations

BLE121LR is compatible with industrial standard reflow profile for Pb-free solders. The reflow profile used is dependent on the thermal mass of the entire populated PCB, heat transfer efficiency of the oven and particular type of solder paste used. Consult the datasheet of particular solder paste for profile configurations.

Silicon Laboratories will give following recommendations for soldering the module to ensure reliable solder joint and operation of the module after soldering. Since the profile used is process and layout dependent, the optimum profile should be studied case by case. Thus following recommendation should be taken as a starting point guide.

- Refer to technical documentations of particular solder paste for profile configurations
- Avoid using more than one flow.
- Reliability of the solder joint and self-alignment of the component are dependent on the solder volume. Minimum of 100µm stencil thickness is recommended.
- Aperture size of the stencil should be 1:1 with the pad size.
- A low residue, “no clean” solder paste should be used due to low mounted height of the component.

Figure 26: Reference reflow profile

9 Block diagram

BLE121LR is based on TI's CC2541 chip. Embedded 32 MHz and 32.678 kHz crystals are used for clock generation. Matched balun and low pass filter provide optimal radio performance with extremely low spurious emissions.

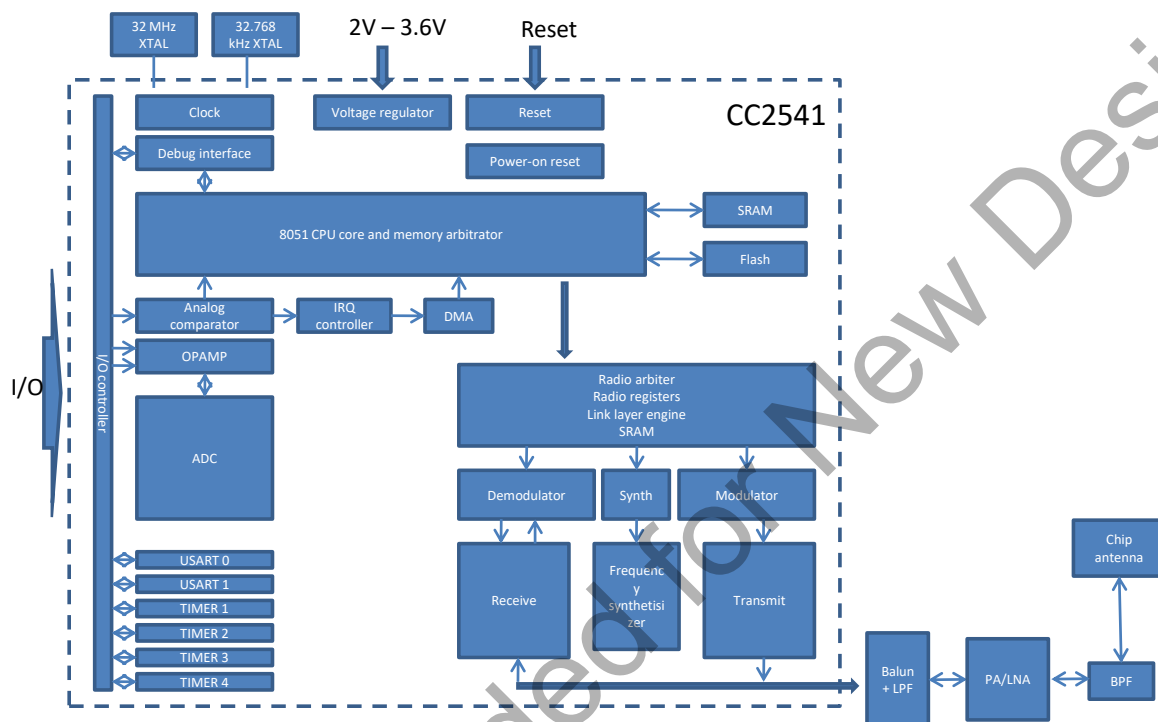

Figure 27: Simplified block diagram of BLE121LR

CPU and Memory

The 8051 CPU core is a single-cycle 8051-compatible core. It has three different memory access buses (SFR, DATA, and CODE/XDATA), a debug interface, and an 18-input extended interrupt unit.

The memory arbiter is at the heart of the system, as it connects the CPU and DMA controller with the physical memories and all peripherals through the SFR bus. The memory arbiter has four memory-access points, access of which can map to one of three physical memories: an SRAM, flash memory, and XREG/SFR registers. It is responsible for performing arbitration and sequencing between simultaneous memory accesses to the same physical memory.

The SFR bus is a common bus that connects all hardware peripherals to the memory arbiter. The SFR bus also provides access to the radio registers in the radio register bank, even though these are indeed mapped into XDATA memory space.

The 8-KB SRAM maps to the DATA memory space and to parts of the XDATA memory spaces. The SRAM is an ultralow-power SRAM that retains its contents even when the digital part is powered off (power modes 2 and 3).

The 256 KB flash block provides in-circuit programmable non-volatile program memory for the device, and maps into the CODE and XDATA memory spaces.

Peripherals

Writing to the flash block is performed through a flash controller that allows page-wise erasure and 4-bitwise programming.

A versatile five-channel DMA controller is available in the system, accesses memory using the XDATA memory space, and thus has access to all physical memories. Each channel (trigger, priority, transfer mode,

addressing mode, source and destination pointers, and transfer count) is configured with DMA descriptors that can be located anywhere in memory. Many of the hardware peripherals (AES core, flash controller, USARTs, timers, ADC interface, etc.) can be used with the DMA controller for efficient operation by performing data transfers between a single SFR or XREG address and flash/SRAM.

Each CC2541 contains a unique 48-bit IEEE address that can be used as the public device address for a *Bluetooth* device. Designers are free to use this address, or provide their own, as described in the *Bluetooth* specification.

The interrupt controller services a total of 18 interrupt sources, divided into six interrupt groups, each of which is associated with one of four interrupt priorities. I/O and sleep timer interrupt requests are serviced even if the device is in a sleep mode (power modes 1 and 2) by bringing the CC2541 back to the active mode.

The debug interface implements a proprietary two-wire serial interface that is used for in-circuit debugging. Through this debug interface, it is possible to erase or program the entire flash memory, control which oscillators are enabled, stop and start execution of the user program, execute instructions on the 8051 core, set code breakpoints, and single-step through instructions in the code. Using these techniques, it is possible to perform in-circuit debugging and external flash programming elegantly.

The I/O controller is responsible for all general-purpose I/O pins. The CPU can configure whether peripheral modules control certain pins or whether they are under software control, and if so, whether each pin is configured as an input or output and if a pullup or pulldown resistor in the pad is connected. Each peripheral that connects to the I/O pins can choose between two different I/O pin locations to ensure flexibility in various applications.

The sleep timer is an ultra-low power timer that uses an external 32.768-kHz crystal oscillator. The sleep timer runs continuously in all operating modes except power mode 3. Typical applications of this timer are as a real-time counter or as a wake-up timer to exit power modes 1 or 2.

Timer 1 is a 16-bit timer with timer/counter/PWM functionality. It has a programmable prescaler, a 16-bit period value, and five individually programmable counter/capture channels, each with a 16-bit compare value. Each of the counter/capture channels can be used as a PWM output or to capture the timing of edges on input signals. It can also be configured in IR generation mode, where it counts timer 3 periods and the output is ANDed with the output of timer 3 to generate modulated consumer IR signals with minimal CPU interaction.

Timer 2 is a 40-bit timer used by the *Bluetooth* low energy stack. It has a 16-bit counter with a configurable timer period and a 24-bit overflow counter that can be used to keep track of the number of periods that have transpired. A 40-bit capture register is also used to record the exact time at which a start-of-frame delimiter is received/transmitted or the exact time at which transmission ends. There are two 16-bit timer-compare registers and two 24-bit overflow-compare registers that can be used to give exact timing for start of RX or TX to the radio or general interrupts.

Timer 3 and timer 4 are 8-bit timers with timer/counter/PWM functionality. They have a programmable prescaler, an 8-bit period value, and one programmable counter channel with an 8-bit compare value. Each of the counter channels can be used as PWM output.

USART 0 and USART 1 are each configurable as either an SPI master/slave or a UART. They provide double buffering on both RX and TX and hardware flow control and are thus well suited to high-throughput full-duplex applications. Each USART has its own high-precision baud-rate generator, thus leaving the ordinary timers free for other uses. When configured as SPI slaves, the USARTs sample the input signal using SCK directly instead of using some oversampling scheme, and are thus well-suited for high data rates.

The AES encryption/decryption core (with CBC-MAC) allows the user to encrypt and decrypt data using the AES algorithm with 128-bit keys.

The ADC supports 7 to 12 bits of resolution with a corresponding range of bandwidths from 30-kHz to 4-kHz, respectively. DC and audio conversions with up to eight input channels (I/O controller pins) are possible. The inputs can be selected as single-ended or differential. The reference voltage can be internal, AVDD, or a single-ended or differential external signal. The ADC also has a temperature-sensor input channel. The ADC can automate the process of periodic sampling or conversion over a sequence of channels.

The I²C module provides a digital peripheral connection with two pins and supports both master and slave

operation. I²C support is compliant with the NXP I2C specification version 2.1 and supports standard mode (up to 100 kbps) and fast mode (up to 400 kbps). In addition, 7-bit device addressing modes are supported, as well as master and slave modes..

The ultralow-power analog comparator enables applications to wake up from PM2 or PM3 based on an analog signal. Both inputs are brought out to pins; the reference voltage must be provided externally. The comparator output is connected to the I/O controller interrupt detector and can be treated by the MCU as a regular I/O pin interrupt.

RF front end

RF front end includes balun, power amplifier, low noise amplifier, band pass filter, and a ceramic chip antenna with matching network. Optimal matching combined with effective low pass filter provides extremely low in-band spurious emissions and harmonics.

11 Certifications

BLE121LR is compliant to the following specifications.

11.1 Bluetooth

BLE121LR is qualified as a Controller Subsystem with QD ID 57409. A Bluetooth End Product can be implemented by combining BLE121LR Controller Subsystem with the muLLEt Host Host Subsystem with QD ID 34551.

11.2 FCC and IC

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) this device may not cause harmful interference, and
- (2) this device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by Silicon Laboratories could void the user's authority to operate the equipment.

FCC RF Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance. This transmitter meets both portable and mobile limits as demonstrated in the RF Exposure Analysis. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with FCC multi-transmitter product procedures.

IC Statements:

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

OEM Responsibilities to comply with FCC and Industry Canada Regulations

The BLE121LR module has been certified for integration into products only by OEM integrators under the following condition:

- The transmitter module must not be co-located or operating in conjunction with any other antenna or transmitter except in accordance with FCC multi-transmitter product procedures.

As long as the condition above is met, further transmitter testing will not be required. However, the OEM integrator is still responsible for testing their end-product for any additional compliance requirements required with this module installed (for example, digital device emissions, PC peripheral requirements, etc.).

IMPORTANT NOTE: In the event that the above condition can not be met (for certain configurations or co-location with another transmitter), then the FCC and Industry Canada authorizations are no longer considered valid and the FCC ID and IC Certification Number can not be used on the final product. In these circumstances, the OEM integrator will be responsible for re-evaluating the end product (including the transmitter) and obtaining a separate FCC and Industry Canada authorization.

End Product Labeling

The BLE121LR module is labeled with its own FCC ID and IC Certification Number. If the FCC ID and IC Certification Number are not visible when the module is installed inside another device, then the outside of the device into which the module is installed must also display a label referring to the enclosed module. In that case, the final end product must be labeled in a visible area with the following:

“Contains Transmitter Module FCC ID: QOQBLE121LR”

“Contains Transmitter Module IC: 5123A-BGTBLE121LR”

or

“Contains FCC ID: QOQBLE121LR”

“Contains IC: 5123A-BGTBLE121LR”

The OEM integrator has to be aware not to provide information to the end user regarding how to install or remove this RF module or change RF related parameters in the user manual of the end product.

11.2.1 FCC et IC

Déclaration d'IC :

Ce dispositif est conforme aux normes RSS exemptes de licence d'Industrie Canada. Son fonctionnement est assujéti aux deux conditions suivantes : (1) ce dispositif ne doit pas provoquer de perturbation et (2) ce dispositif doit accepter toute perturbation, y compris les perturbations qui peuvent entraîner un fonctionnement non désiré du dispositif.

Selon les réglementations d'Industrie Canada, cet émetteur radio ne doit fonctionner qu'avec une antenne d'une typologie spécifique et d'un gain maximum (ou inférieur) approuvé pour l'émetteur par Industrie Canada. Pour réduire les éventuelles perturbations radioélectriques nuisibles à d'autres utilisateurs, le type d'antenne et son gain doivent être choisis de manière à ce que la puissance isotrope rayonnée équivalente (P.I.R.E.) n'excède pas les valeurs nécessaires pour obtenir une communication convenable.

Responsabilités des OEM quant à la conformité avec les réglementations de FCC et d'Industrie Canada

Les modules BLE121LR ont été certifiés pour entrer dans la fabrication de produits exclusivement réalisés par des intégrateurs dans les conditions suivantes :

- Le module transmetteur ne doit pas être installé ou utilisé en concomitance avec une autre antenne ou un autre transmetteur.

Tant que ces deux conditions sont réunies, il n'est pas nécessaire de procéder à des tests supplémentaires sur le transmetteur. Cependant, l'intégrateur est responsable des tests effectués sur le produit final afin de se mettre en conformité avec d'éventuelles exigences complémentaires lorsque le module est installé (exemple : émissions provenant d'appareils numériques, exigences vis-à-vis de périphériques informatiques, etc.)

REMARQUE IMPORTANTE : En cas d'inobservance de ces conditions (en ce qui concerne certaines configurations ou l'emplacement du dispositif à proximité d'un autre émetteur), les autorisations de FCC et d'Industrie Canada ne seront plus considérées valables et l'identification de FCC et le numéro de certification d'IC ne pourront pas être utilisés sur le produit final. Dans ces cas, l'intégrateur OEM sera chargé d'évaluer à nouveau le produit final (y compris l'émetteur) et d'obtenir une autorisation indépendante de FCC et d'Industrie Canada.

Étiquetage du produit final

Le module BLE121LR est étiqueté avec sa propre identification FCC et son propre numéro de certification IC. Si l'identification FCC et le numéro de certification IC ne sont pas visibles lorsque le module est installé à l'intérieur d'un autre dispositif, la partie externe du dispositif dans lequel le module est installé devra également présenter une étiquette faisant référence au module inclus. Dans ce cas, le produit final devra être étiqueté sur une zone visible avec les informations suivantes :

« Contient module émetteur identification FCC : QOQBLE121LR »

« Contient module émetteur IC : 5123A-BGTBLE121LR »

ou

« Contient identification FCC : QOQBLE121LR »

« Contient IC : 5123A-BGTBLE121LR »

Dans le guide d'utilisation du produit final, l'intégrateur OEM doit s'abstenir de fournir des informations à l'utilisateur final portant sur les procédures à suivre pour installer ou retirer ce module RF ou pour changer les paramètres RF.

11.3CE

The BLE121LR is tested against the relevant harmonized standards and is compliant with the essential requirements and other relevant requirements of the Radio Equipment Directive (RED)(2014/53/EU).

Please notice that every end-product integrating the BLE121LR module will need to perform the radio EMC tests on the end-product, according to EN 301 489-17. It is ultimately the responsibility of the manufacturer to ensure the compliance of the end-product as a whole. The specific product assembly may have an impact to RF radiated characteristics, and manufacturers should carefully consider RF radiated testing with the end-product assembly.

The module is entitled to carry the CE mark, and a formal Declaration of Conformity (DoC) is available at the product web page which is reachable starting from www.silabs.com.

11.4 MIC Japan

BLE121LR is certified as a module with type certification number 209-J00111. As a certified module BLE121LR can be integrated to an end product without a need for additional MIC Japan certification of the end product.

11.5 Anatel (Brazil)

BLE121LR is certified in Brazil with Anatel certification number: 01238-16-03402

The user manual of the equipment that integrates this module must contain the following sentences:

"This equipment integrates a Bluetooth radio wireless module having Anatel homologation code of 01238-16-03402."

"This equipment is not entitled to protection against harmful interference and may not cause interference to other duly authorized systems."

O manual do usuário do equipamento que integra este módulo deve conter as seguintes frases:

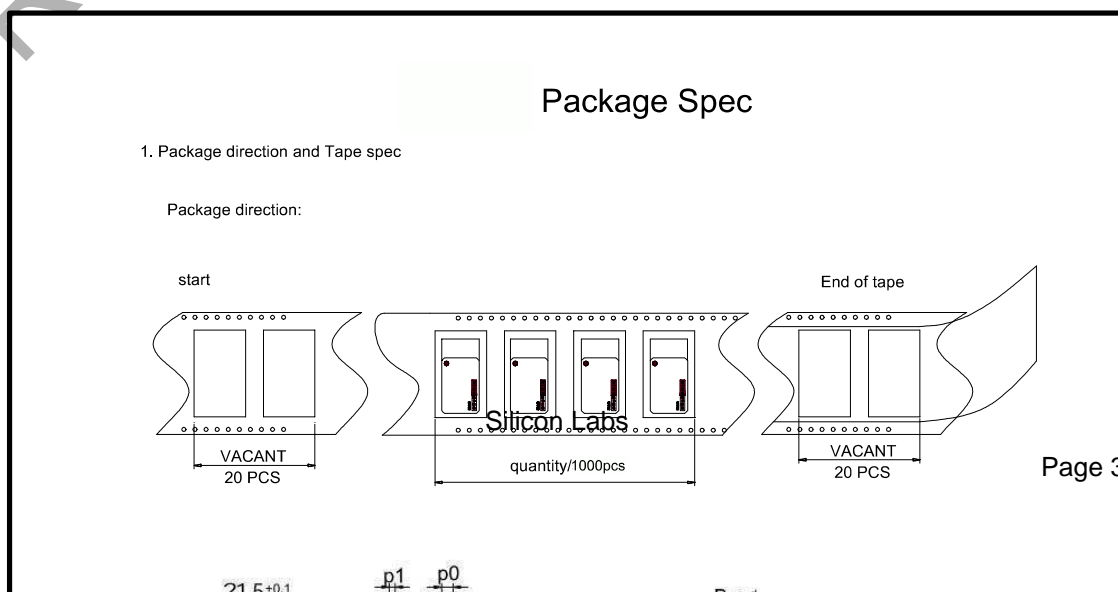

"Este produto contém a placa MODEL código de homologação Anatel 01238-16-03402."

"Este equipamento não tem direito à proteção contra interferência prejudicial e não pode causar interferência em sistemas devidamente autorizados."

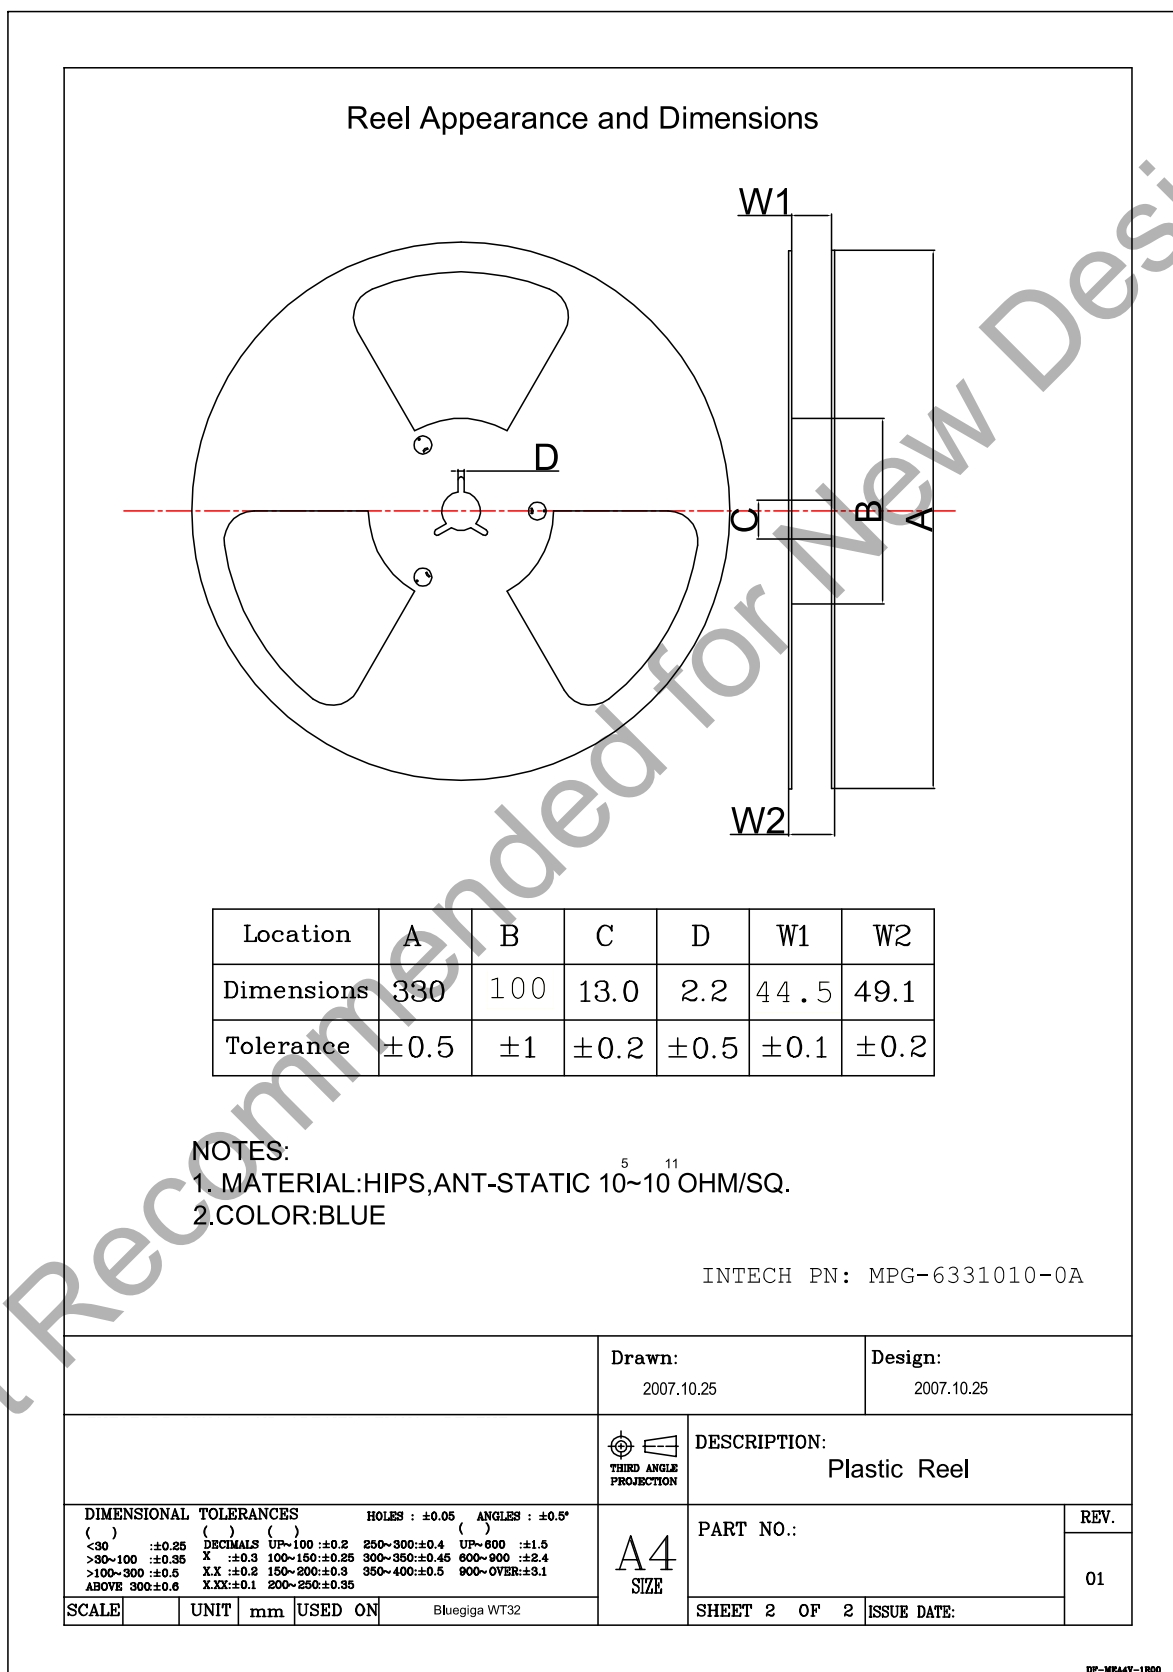

11.6 KCC (Korea)

BLE121LR has type certification in Korea with certification number MSIP-CRM-BGT-BLE121LR
